

Fight The Bite!

Mosquito Control Program

Now is the time to be proactive and choose our integrated mosquito control program. Aside from our biological control of mosquito eating fish “Gambusia holbrooki”, we now are offering an integrated management program. EECl is incorporating a larvacide (VectoBac) in both granular and liquid form into our management plan. The larvacide has a growth blocking hormone that prevents larvae and pupae stages of mosquito from becoming the nuisance biting adults. Our treatment areas will include permanent water bodies and semi-permanent water bodies or low depressions which frequently floor creating sources for breeding mosquitoes. By integrating our mosquito control program these problem areas will be able to be effectively managed. The warmer the weather get, the shorter the mosquitoes stay in the larva and pupae stages. Our products being used meet the industry standard and are the safest biological control.
