## Animal Feces: Impact on Stormwater Management Pond Water Quality

Dog feces left on the ground and in the "watershed" to your subdivision stormwater management ponds can lead to nutrients and pathogens transporting into the pond's water column. Feces that are not cleaned up may travel with water during significant rain events. The nitrogen and phosphorus within the feces degrades the water quality, which can stimulate algae blooms and provoke E-Coli and fecal coliform contamination to your water column. Dog feces must be cleaned up and disposed of properly into a solid waste container. Please protect your water quality!

If you have any questions or concerns, please contact EECl's professional office at 302.684.5201 or via email at [info@envirotechecinc.com](mailto:info@envirotechecinc.com)!
